

# Design of Scaleable Photobioreactors for Mass Production of **Algae** for Biofuel Production

Joel L. Cuello,  
Michael Mason and Michael Kazz  
The University of Arizona

# Critical Need for Other Biomass Feedstocks

Algae!

*Nostoc sp.*

*Chlorococcum littorale*

*Chlorella sp.*

*Spirulina sp.*

# Why Algae?

- Some accumulate hydrocarbons
- Some accumulate fatty acids
- Some accumulate starch
- Some produce hydrogen gas

# **Algae: Major Advantages**

**(1) renewable energy source**

**(2) potential for reduction of emissions from power plants**

**(3) much higher productivity than traditional fast-growing energy crops**

**(4) less area required than traditional crops when grown in photobioreactors**

# Algae: Major Advantages

**(5) production in photobioreactors prevents potential degradation of soil and groundwater**

**(6) non-potable water can be used, aiding in wastewater treatment and utilizing non-productive areas**

**(7) production of economically valuable chemicals**

# Algae: Major Advantages

**(8) Energy feedstock that does not compete with food or feed!**

## **Algae: Biodiesel Yield (L/ha-yr)**

<b>Soybeans</b>	<b>446</b>
<b>Rapeseed</b>	<b>119</b>
<b>Mustard</b>	<b>1300</b>
<b>Jatropha</b>	<b>1892</b>
<b>Palm Oil</b>	<b>5950</b>
<b>Algae (Low)</b>	<b>45000</b>
<b>Algae (High)</b>	<b>137000</b>
<b>Ours (High)</b>	<b><u>132,300!</u></b>

# *Botryococcus braunii* for Hydrocarbon Production

# Biofuel Production from Algae

- 1) Species/Strain Selection
- 2) Mass Production of Algae
- 3) Downstream Processing

# Open Pond Cultivation Challenges

- **Pollution**
  - Soot flakes from furnaces of sugar factory
  - Heavy metals
    - Algae can accumulate heavy metals
    - Intracellular concentration of heavy metals of 1000x higher than the surrounding medium has been observed
    - Could come from air pollution by industries (Cd from fertilizer)

# Open Pond Cultivation Challenges

- **Infection**

- parasites, protozoa, insect larvae, unwanted algae species
- causes loss of culture
- e.g., in India, infestation by Ephydra fly of 30 insect larvae/L in Spirulina culture reduced algae yield by 30%

# Open Pond Cultivation Challenges

- **Poor CO<sub>2</sub> usage**
  - most of the CO<sub>2</sub> bubbled into the pond is lost into the atmosphere

# Open Pond Cultivation Challenges

- **Sub-optimal use of land area**
  - Requires strictly two-dimensional surface area expansion for large-scale operation (as opposed to three-dimensional volume expansion)

Delivery of CO<sub>2</sub>

Delivery of Nutrients

Adequate Mixing

Optimal Culture density

# Photobioreactor

Algae

The diagram shows a central orange rectangular column representing the photobioreactor. Inside this column, the word 'Algae' is written in white. To the right of the column, a list of controlled parameters is shown in green text. A white arrow points from the 'Mixing' parameter to the right side of the orange column.

Controlled

Light

Nutrients

CO<sub>2</sub>

Mixing

Culture Density

pH

Temperature

Flow Rate

etc.

# Scaleable Photobioreactor Design
